

Mobile Robot Challenge Remarks

As mentioned in the assignment:

- **Home Position:** the home position will be clearly marked.
- The robot should face forward at the Home Position.
- The only allowed sensor data used by the robot are its RGB camera data.
- Object is
 - dragged along, i.e., no static orientation relative to the robot.
 - always touching the floor.
 - It is not allowed to attach the object to the robot.
- You are not allowed to take your own floor, or light with you

Further clarifications (see also assignment for depictions and steps):

- Offline processing (e.g. on your notebook, etc.) is allowed as long as the robot is responsive.
- The challenge is done at the area in front of the projector screen.
- The red blocks depicted in the assignment are just abstract placeholders for some objects/boxes/pylons that will be used during the challenge.
- Their size will be ~1 - 3 times the box in which you store the car. Examples will not be available beforehand.
- During Step 2 of both Challenge I and II, you are allowed to rotate the robot on the starting position, automatically or by hand, while capturing and processing is executed. After the given time of max 1 minute, it must face forward again.
- Only during Step 3, the (known/unknown) object will be placed in front of the robot
